Module Variations

Module Variations allow for the individual styling of each module within a position, without it being global. Code wise, this is achieved by adding a class into the module code which loads from the **Module Class Suffix** field in the Module Manager. The theme CSS adjusts accordingly.

Enter any available suffixes at **Extensions** ▯ **Module Manager** ▯ *Module* ▯ **Module Class Suffix**

There are 11 suffixes: **tab1-3**, **bg1-3**, **underline**, **number** and **flush**, **flushtop**, **flushbottom**.

The **Tab** suffixes add a solid background image behind the header, in the shape of a tab. The **B G**
suffixes change the color of the module background only.
Underline
simply adds a border to the bottom of the module header. Remember, you can always combine suffixes together such as
tab3 b2
, which will produce a colored module title, with a colored background.
Number
is specifically designed for the menu module, adding a decimal list before the border graphic.

Flush will disable all padding and margin to the module for a tighter fit, with **FlushTop** and **Flu shBottom**
disabling the margin/padding for the Top/Bottom parts of the module respectively.
